“WHAT” IS FIND A PEST

FIRSTLY, WHAT IS A PEST?

A pest is any organism (e.g., plant, animal or fungus) that can affect plant, animal or human health.

New Zealand is free of many harmful pests and surveillance is critical to prevent their establishment. Surveillance also assists in the management of recently established pests by allowing 'slow the spread' tactics, thus reducing pest management costs.

WHAT IS FIND-A-PEST

Find-A-Pest is a general biosecurity surveillance tool.

Your link to your primary sector's biosecurity team.

A way to get identification help from NZ's largest biological citizen science community.

Your source for key biosecurity news items relevant to your sector.

BIOSECURITY 2025

WHY IS SURVEILLANCE VITAL?

Early detection is crucial

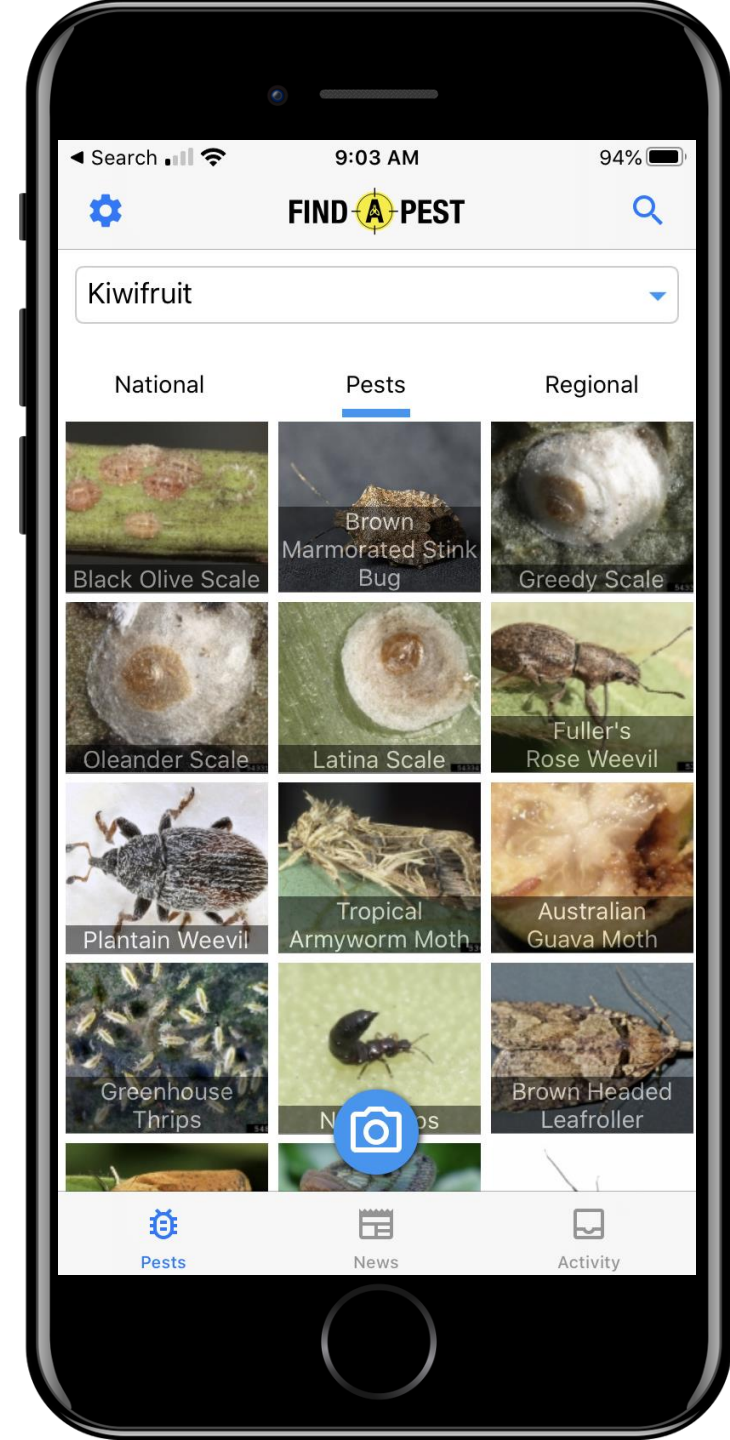

“Go hard, go early - surveillance is vital for primary sector biosecurity. Finding things early gives us options and provides the best chance to prevent the establishment of pests that would damage our economy or environment.”

- Stu Hutchings CE KVH and Chair of Plant Biosecurity Council

HOW CAN YOU HELP?

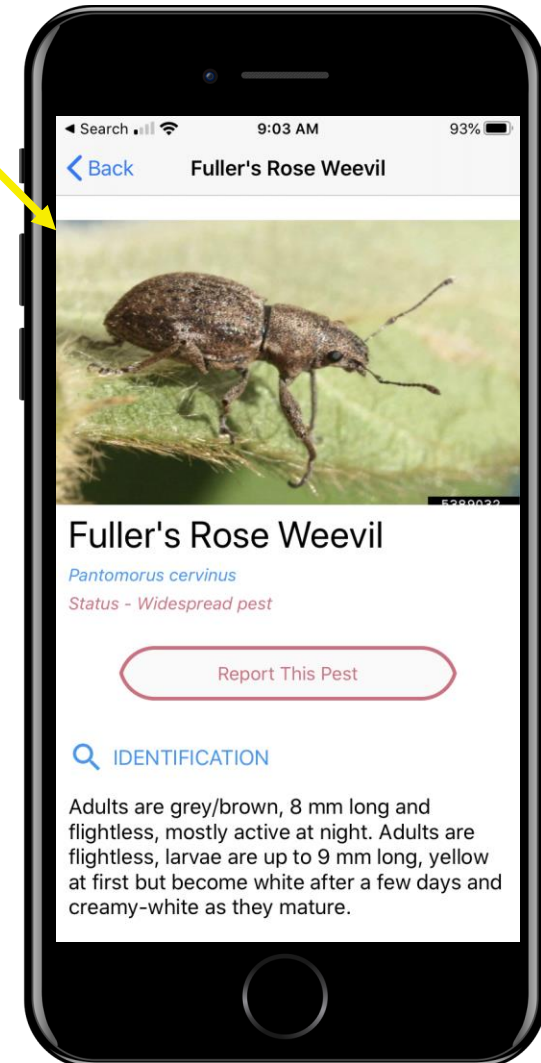

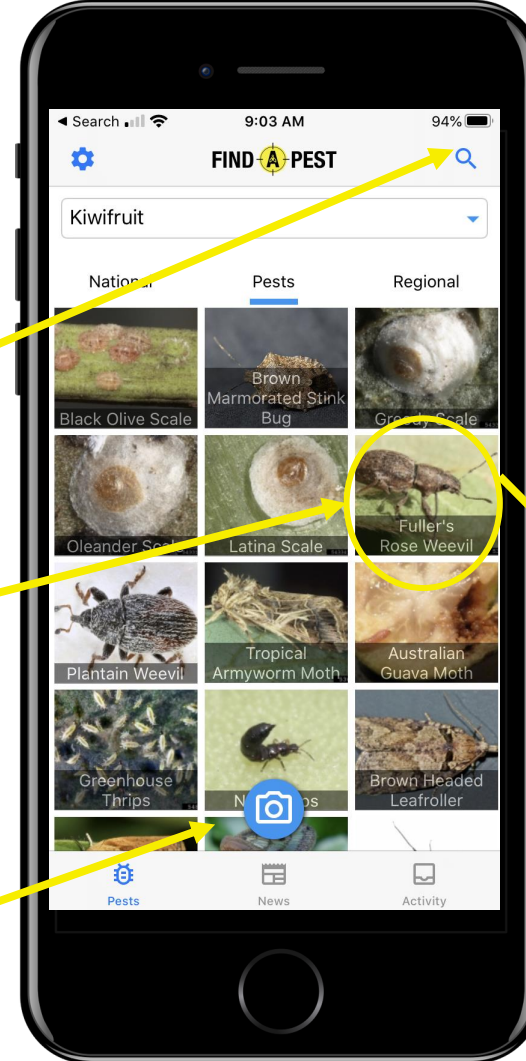

- Grow your understanding of what pests and weeds are 'normal' for you.
- Immediately submit an observation of anything unusual that you don't recognize.
- Work on your photography skills!

HOW IT WORKS?

- Three ways to be a biosecurity champion:

1. **Search tool:** When you know what you are seeing.
2. **Factsheets:** Information on common pests of your sector and threats not yet present in NZ.
3. **Camera button:** To submit an observation of anything you are concerned about.

WHAT HAPPENS TO MY OBSERVATION

Find-A-Pest observations

African Club Moss OBSERVATIONS

Stats

- Totals
- 772 Observations
- 251 Species
- 107 People

Most Observations

- willy_gamble (754 observations)
- jon_sullivan (25 observations)
- kowhataraire (28 observations)
- tripkazel (22 observations)
- rmibe (22 observations)

Most Species

- jon_sullivan (42 species)
- willy_gamble (42 species)
- kowhataraire (38 species)
- rmibe (14 species)
- stevenson (12 species)

Most Observed Species

- Darwin's Barberry (71 observations)
- Gorse (42 observations)
- Chikan Flame Creeper (34 observations)
- Moth Plant (16 observations)
- Tutan (27 observations)

About

This project contains observations made on the Find-A-Pest New Zealand biosecurity surveillance app and made public on iNaturalist NZ.

The Find-A-Pest app makes it easy to learn about the worst pests and weeds relevant to your region and industry and make observations of these and any other pests.

Find-A-Pest is soft ...more

NEW **Identified**

FIND A PEST

Observation ID#584

Rebecca Turner

Identified

Taxon Name: Greater Lady Beetles (Harmonia / Insecta)

Rank: genus

Comment: Couldn't find anything close to this in NZ using the iNaturalist. app

Made public on iNaturalist NZ

Submitted: 2019-04-26 11:22:05

Observed: 2019-04-23 14:20:15

Location: Hurunui, CA, NZ

Description: ladybird found 103 jollies pass road, Hamner Springs

ADDITIONAL FEATURES

- Find-A-Pest keeps you in touch with the latest biosecurity news from your sector and invites to biosecurity training events.
- This is where the Find-A-Pest team, iNaturalist NZ and potentially Biosecurity NZ will keep you up to date with comments and identifications on your observations

FIND A PEST TOMORROW

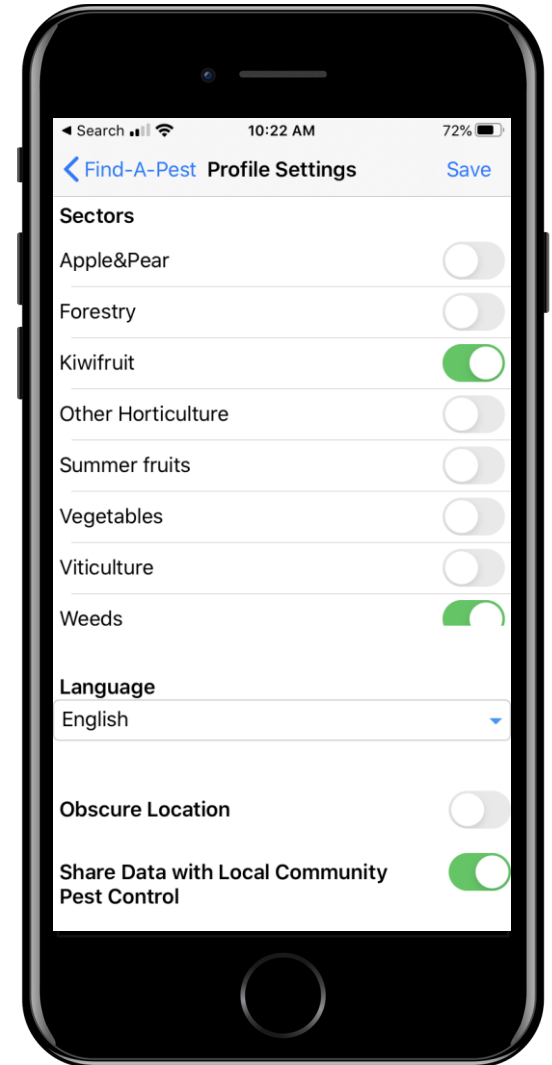

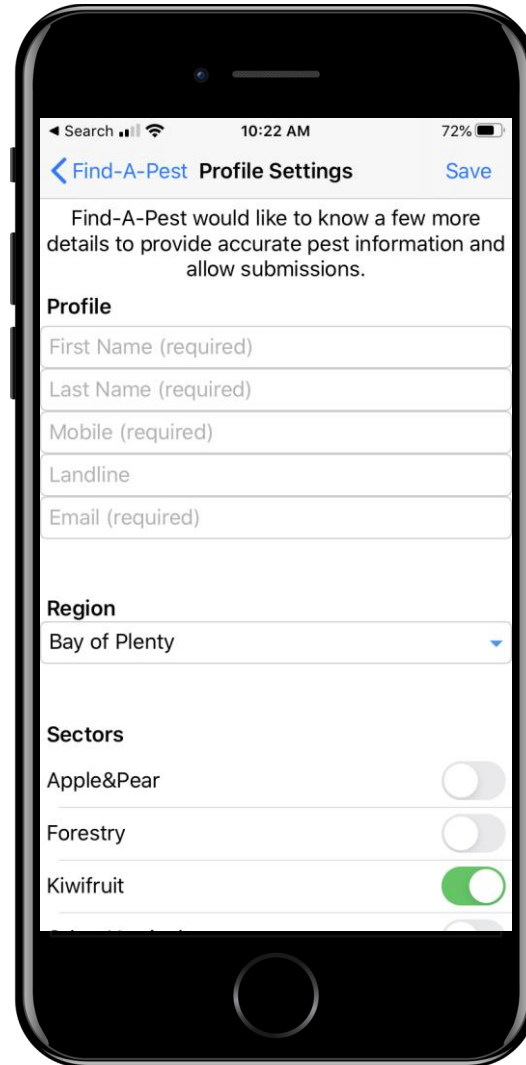

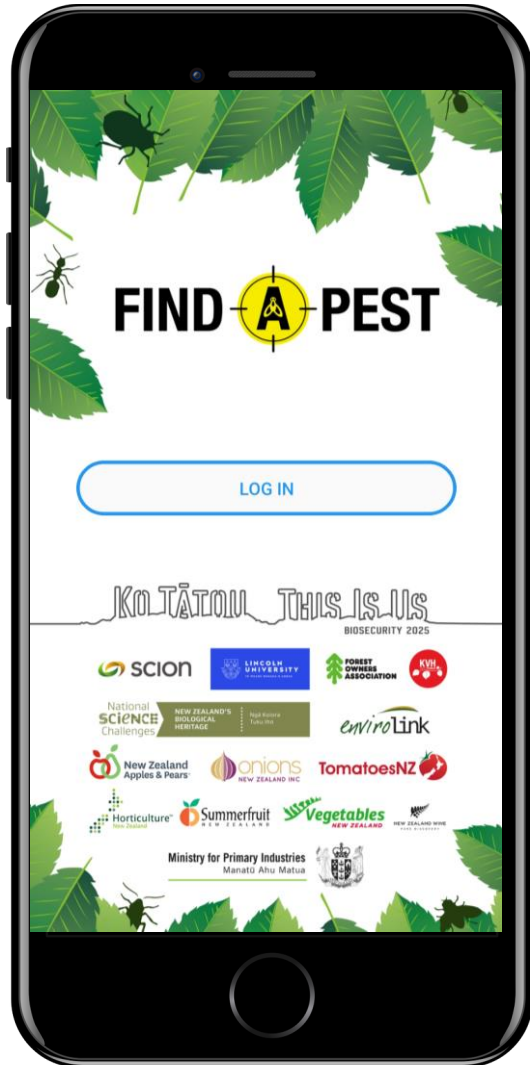

- Seamless integration into stakeholder databases ensures surveillance data informs operational decisions.
- Observations made via camera screened by iNaturalist NZ image recognition systems.
- Fully georeferenced ensuring that user effort is directed towards high priority pests/weeds at their location.
- Full integration of deep learning species recognition tools to reduce the burden of screening observations for potential threats.
